1.1. Monitor Control Locations & Functions

| | KEY TO BUILT-IN | MONITOR CONTROL FUNCTIONS |
|----------|------------------------|--|
| 0 | OSD | Press to enter and exit the OSD menus. |
| 0 | Select buttons | Press to select the OSD option to change. |
| 0 | Recall | Press to recall the factory preset defaults. |
| 0 | Adjustment buttons | Use these to increase or decrease values when adjusting the OSD options. |
| Θ | Degauss | Press to degauss the monitor |
| 0 | Brightness | Press to increase or decrease the monitor's brightness |
| 0 | Contrast | Press to increase or decrease the monitor's contrast. |
| 3 | Power On / Off | Press to turn on or off the power to the monitor. |

1.2. Product Overview

The monitor 1769DC-1 described in this service manual has the following features:

- □ 17 inch 0.27 or 0.28mm dot pitch conventional CRT
- □ 30-69kHz horizontal scanning
- □ Ten preset modes
- ☐ Universal segmented auto range power supply
- □ VESA/NUTEK/EPA compliant power management

1.3. CRT Characteristics

- ☐ Faceplate Type..... FS
- □ Orientation..... Landscape
- ☐ Phosphor Dot Pitch 0.27 or 0.28mm
- □ Electron Gun 29mm, Precision-In-Line
- □ Deflection Angle 90 degree diagonal
- □ Shadow Mask Invar
- □ Phosphor Type..... P22
- □ Phosphor Persistence..... Medium Short
- ☐ Faceplate Properties..... ASN antistatic, antireflection
- □ Standard Light Transmission. 53.5% Typical

1.4. Power Specifications

- □ A/C Receptacle IEC320
- □ Power Supply Type Universal
- □ A/C Line Voltage Ranges . . . 88VAC 132VAC
 - 180VAC 264VAC
- □ A/C Line Frequency Ranges . 50Hz/60Hz ±3Hz
- ☐ Inrush Current 30A/132V or
 - 50A/264V (at cold start)
- □ Leakage Current ≤3.5ma
- □ Degauss Automatic and Manual

1.5. Video Input Signal Characteristics

- □ Video Type Analog
- □ Amplitude 700mV maximum
- □ Video Input Impedance 75 Ohms ±1%
- □ Video Connector Pin Assignments:

| Pin | Signal | Pin | Signal | Pin | Signal |
|-----|-------------|-----|-------------|-----|-------------|
| 1 | Red video | 6 | Red return | 11 | Monitor GND |
| 2 | Green video | 7 | Greenretum | 12 | SDA |
| 3 | Blue video | 8 | Blue return | 13 | H. sync. |
| 4 | Monitor GND | 9 | No pin | 14 | V. sync. |
| 5 | Return | 10 | Sync return | 15 | SCL |

1.6. Sync Input Signal Characteristics

1.6.1. Separate Sync

- □ Sync Type TTL
- ☐ Amplitude 2.4V minimum (Logic High)

0.8V max. (Logic Low)

□ Polarity...... Positive or Negative

1.7. Video Amplifier Performance

- □ Video rate 110MHz
- ☐ 90% Rise and fall times. . . . 12ns (Measurement shall be made at CRT connector, with output swinging 30Vpp)
- ☐ Video generator rise/fall time 2ns maximum
- ☐ Scope and probe bandwidth . 350MHz minimum
- □ Probe capacitance 2.5pf
- Overshoot/Undershoot 15% max.

1.8. Environmental

1.8.1. Temperature / Humidity / Altitude

OPERATING

- □ Temperature..... 10°C to 35°C
- ☐ Relative Humidity . 0 to 90%, non-condensation
- ☐ Altitude 0 to 10,000 feet

NON-OPERATING

- □ Temperature.... -40°C to +65°C
- ☐ Relative Humidity . 0 to 95%, non-condensation
- ☐ Altitude 0 to 40,000 feet

1.8.2. Vibration Test

UNPACKED UNIT

| | Frequency | Amplitude (mam) | Acceleration (G) |
|---|-----------|-----------------|------------------|
| 1 | 5 - 22Hz | 0.25mm | - |
| 2 | 22-500Hz | | 0.25G |

Times/Cycle:

- □ Rise Time..... 10 Minutes
 - ☐ Fall Time 10 Minutes
 - □ Number of Sweeps 1 Cycle
 - □ Axis X,Y,Z
 - □ Total Times 60 Minutes

PACKAGED UNIT

| | Frequency | Amplitude (m/m) | Acceleration (G) | |
|---|-----------|-----------------|------------------|--|
| 1 | 5 - 50Hz | _ | 0.83 | |
| 2 | 7 | (57) | _ | |
| | □ Times/6 | Puole: | | |

- □ Times/Cycle:
- □ Rise Time...... 10 Minutes
- □ Fall Time 10 Minutes

| Number of Sweeps 1 Cycle |
|--------------------------|
| Axis X,Y,Z |

□ Total Times 60 Minutes

1.8.3. Drop Test

□ Compliant with NSTA Project 1A guidelines

□ Drop Height 46cm

☐ Test Direction . . . 1 Corner, 3 Edges, 6 Faces

1.9. Preset Timing Modes

This display has 10 preset display modes configured during manufacture, given in the following table:

| Model No. | HI KHZ | VERIE | Pixel Rat |
|-----------|--------|--------|-----------|
| 01 | 60.023 | 75.029 | 78.750 |
| 02 | 58.230 | 72.245 | 75.000 |
| 03 | 50.000 | 87.030 | 80.000 |
| 04 | 48.077 | 72.188 | 50.000 |
| 05 | 46.875 | 75.000 | 49.500 |
| 06 | 37.879 | 60.317 | 40.000 |
| 07 | 37.861 | 72.809 | 31.500 |
| 08 | 37.500 | 75.000 | 31.500 |
| 09 | 35.520 | 86.960 | 44.900 |
| 10 | 31.469 | 59.940 | 25.175 |

Section 2.

Disassembly Instructions

| 2.1. | Removing the Cabinet |
|------|---|
| 2.2. | Internal Disassembly (Right Side)2-1 |
| 2.3. | Internal Disassembly (Left Side) 2-2 |
| 2.4. | Removing the Main Board2-2 |
| 2.5. | Removing the Control Panel 2-2 |
| 2.6. | Removing the Control PCB2-2 |
| 2.7. | Removing the CRT from the Front Bezel 2-2 |

2.1. Removing the Cabinet

- (A). Remove the four screws at the rear of the display.
- (B). Lift the cover vertically away from the monitor.

Figure 2-1 Removing the Cabinet

2.2. Internal Disassembly (Right Side)

The neck board is plugged onto the CRT neck and is enclosed in a metal shielding.

- (A). Disconnect the degaussing coil from the main board.
- (B) Removing the screw from the chassis rear.
- (C) Disconnect the ground wires from the metal casing of the neck board.
- (D) Remove the Lock Cap from the nylon ties.

Figure 2-2 Internal Disassembly (Right Side)

2.3. Internal Disassembly (Left Side)

- (A) Remove the ground wires from the neck board casing. You may now remove the neck board from the CRT if required. The neck board is secured in place on the CRT neck with Sony bond. Use a flat head screwdriver to prise this away and then pull the neck board away from the CRT neck.
- (B) Undo the screw holding the ground wire to the metal frame.
- (C) Disconnect the ribbon cable from the logic board and the cable from the CRT connected to the rear side of the logic board.
- (D) Remove the CRT anode cap.
- (E) Cut the cable tie indicated to free the cables.
- (F) Disconnect the 4-pin connector on the CRT yoke cable. You may now remove the logic board if required.
- (G) Remove the Neck PCB from the CRT.

Figure 2-3 Internal Disassembly (Left Side)

2.4. Removing the Main Board

- (A) Place the display flat on its face and remove the nylon rivets holding the main board in place on the frame.
- (B) Hold the from bezel with one hand and withdraw the main board vertically from the CRT assembly. It may be necessary to pull the plastic frame on either side outwards slightly to disengage the main board from the plastic frame.

Figure 2-4 Removing the Main PCB

2.5. Removing the Control Panel

- (A) Remove the plastic rivets from the bottom of the control panel.
- (B) Pull the control panel sub-assembly away from the monitor bezel.

Figure 2-5 Removing the Control Panel

2.6. Removing the Control PCB

- (A) Remove the two screws from the PCB.
- (B) Remove the control PCB from the control panel.

Figure 2-6 Removing the Control PCB

2.7. Removing the CRT from the Front Bezel

- (A) Undo the four screws at each corner of the CRT.
- (B) The CRT can now be separated from the front bezel and the CRT grounding harness and degaussing coil also removed.

Figure 2-7 Removing the CRT from the Front Bezel

according to the frequency, so a compensation value is provided by D12 in order to reduce the difference in total power for different frequencies. In addition, because the AC input ranges from 85VAC to 270VAC, this causes the value of the direct current on the DC bus to vary, affecting the rise rate of IP, the oscillator and the duty cycle, and causing the test value obtained at Pin 3 of IC2 to vary. To resolve this, a compensation value is provided by R39 and R41 which reduces the difference resulting from the different input voltages.

3.1.2. DC to DC Circuit

Another special characteristic of this power supply is the addition of a DC to DC circuit to the output. In order to support the monitor at different frequencies, a similar high voltage is required (26kV). To accommodate this requirement, a buck loop has been added to the 200V output. The synchronization signal is got from the monitor H.D. area, and after getting synchronization through QP1 trigger ICP2, a high voltage feedback signal (FB), is input to QP2 to obtain the DC level. A comparison is carried out between Pin 5 of ICP2 and ICP3 to establish the duty cycle of transistor QP3 (IRF840) so that even under different frequencies, a similar high voltage value is still obtained.

3.2. The Deflection Circuit

Please refer to the block diagram of the deflection circuit and video circuit and Logic circuit.

3.2.1. IC304 TDA9102C

- IC304 TDA9102C is a horizontal and vertical processor. The horizontal section consists of a TTL interface, two comparators and an oscillator. The vertical section consists of a TTL input interface and an oscillator. This IC includes a voltage stabilizer to provide about 8V.
- When sync is input as a TTL level, this causes a negative edge trigger. Pin 4 serves as the H-sync input point and Pin 14 as the V-sync input point.
- Pins 6 and 7 are the collector (C) and emitter
 (E) of the IC's internal transistor. The output from Pin 7 is not enough to drive T301 as the output current of IC304 is small, so Q345 and Q310 are used to amplify the current to drive T301.
- 4. Pins 1 and 2 provide the external control of the horizontal oscillator free run. Free run is controlled by changing the resistance value of R383 R379 R403 and C392 to obtain different DC voltage levels. By adding an external F/V on Pin 1, the difference between a variety of input frequencies and free run is maintained at a similar level. In this way, when different

- timing modes are input, if the ratio between the active display and total display is similar, then the position of the phase will also be similar.
- Pins 12 and 13 provide the external control of the vertical oscillator free run. Free run is controlled by changing the resistance value of R388 to obtain different DC voltage levels. By adding an external F/V on Pin 12, the difference between a variety of input frequencies and free run is maintained as similar. The vertical free run trigger synchronization point will affect the amplitude of Pin 15 V-output. Since the difference between each input frequency and free run is similar, this means the synchronization trigger level is also similar, making the V-OUTPUT at Pin 15 also similar. As long as the ratio of the width of active display to total display is similar, then V-SIZE will be similar. For example, the ratios of 35kHz 800x600 and 37kHz 800x600 are approximately the same so they only use one VR (please refer also to the explanation of vertical deflection).
- The Horizontal phase of different modes can be individually adjusted by changing the VDC level at Pin 10.
- The vertical size of different modes can be individually adjusted by changing the VDC level at Pin 16.
- The vertical linearity can be changed by altering the VDC level at Pin 17.

3.2.2. Vertical Deflection Circuit

- IC201 TDA8172 consists of a flyback generator, voltage stabilizer, drive circuit and vertical output amplifier.
- 2. The vertical oscillator circuit
 - (a) The frequency and phase of the vertical oscillator circuit is generated by the vertical synchronization signal.
 - (b) The synchronization signal is output from Pin 14 of IC304 TDA9102C and, after being processed by the synchronization circuit, is sent to the vertical synchronization oscillator circuit to trigger the vertical oscillator and synchronize the oscillator frequency with the external synchronization signal. The frequency of its internal free oscillation is set by the time constant of R387 and C384. The F/V voltage output from IC307 Pin 15 is used to maintain the difference between the free oscillation frequency and external synchronization signal frequency at a similar level and make the sawtooth wave amplitude from Pin 15 of IC304 the same.

Figure 3-2 Video, Logic and Deflection Block Diagram

3. Vertical Size Control

The pulse voltage output by the oscillator is sent to the sawtooth wave generator. The size and amplitude of the voltage of the sawtooth wave generation can be changed by DC value which output from Pin10,11 of IC306 and the vertical size can thus be controlled. This sawtooth wave voltage passes through a buffer and is output from Pin 15 of IC304 to Pin 1 of IC202 TDA8172 of the vertical drive circuit.

4. Vertical Drive Circuit

(a) It is not sufficient to rely solely on the oscillator circuit output to ensure the stability of the vertical output, so a first or second level amplifier circuit must be inserted between the oscillator circuit and the output. This circuit is called the drive amplifier and in addition to amplifying the sawtooth wave also corrects the vertical linearity.

After adding the drive circuit, because the level of amplification can be considerable, enough negative feedback can be added to correct vertical linearity and increase the stability of the circuit.

(b) If the current of the sawtooth wave flowing through the deflection yoke is distorted, then the top and bottom portions of the display will be expanded or compressed, resulting in poor linearity. In order to solve this problem, correction of the linearity of the sawtooth wave can be carried out before the drive level.

5 IC201 TDA8172 Vertical Drive Circuit

- (a) IC202 uses a double power source, so it can be viewed as an OCL drive amplification circuit.
- (b) Pin 15 of IC304 outputs a sawtooth wave which is input from Pin 1 of IC202 and after being amplified is output from Pin 5 of IC202 to the vertical deflection yoke. R202 through R204 negative feedback to Pin 1 to increase the stability of the circuit.
- (c) Pin 3 of C202 is connected to Pin 6 of D212 to make a compensatory circuit in order to reduce power consumption during flyback operations.

6. Vertical Centering Adjustment

Since IC202 functions as an OCL circuit, VDC is output from Pin 7 of IC201, so the central current can be changed to shift the on-screen display up or down to prevent voltage fluctuation. After adjusting the power stabilizer at Pin 19 of IC304 TDA9102C (about 8V) with R207, R208, R212 and R211, this is input to Pin 7 of IC202 to change the value of the vertical center.

3.2.3. Pincushion Correction Circuit

 If the width of the border in the center of the screen is insufficient, the waveform shown in Figure 3-3 below, can be used to add to horizontal deflection B+ in order to change the deflection of the horizontal deflection circuit.

Figure 3-3 Voltage Correction Wave

This waveform is the parabola obtained after regulation of the vertical period, and is created to perform amplitude modulation on the horizontal deflection current, as shown in Figure 3-4

FH: Horizontal Frequency FV: Vertical Frequency

Figure 3-4 Current Correction Wave

2. The sawtooth wave is output from Pin 15 of IC304 and through IC305 TDA4950 for integration regulation into a parabola. It is output from Pin 5 of IC305 and passed through C354 and R360 and input to Pin 2 of IC302. It is then output from Pin 1 of IC302 and after being sent to Q353's collector output, is added to horizontal B+ to provide pincushion distortion correction.

3.2.4. IC305 TDA4950 Circuit Operation

- TDA4950 consists of a comparator, a wave regulator and a current limiter.
- The sawtooth wave from Pin 15 of IC304
 passes through R406 and R407, coupled to Pin
 2 input, with Pin 3 being a fixed reference
 current, and after VDC conversion in R393
 achieves KEYSTONE compensation.
- The H-sync signal (output from Pin 6 of T302) is input, passes through R397 D374 and C393, generates a sawtooth wave which is input to Pin8 of IC305. It can output a DC value(0~5V)

from Pin12 of IC307, passes through R394 Q359 coupled to Pin8 of IC305, then can change the DC level of the sawtooth wave, and after passing through Pin 1 and Pin 2 of the wave regulator, a fixed parabola wave is generated at Pin 7 (in order to adjust the waveform at Pin 7, the VDC of the sawtooth wave at Pin 8 must be the same as the VDC of Pin 7. Please refer to Figure 3-5.

Figure 3-5 IC305 Pin 7 and Pin 8 Waveform

After the waveform has been modified, although the horizontal frequency is not the same, the waveform output at Pin 5 is not the same, and for this reason can be used to correct pincushion distortion. The waveform output from Pin 5 of IC305 is a square wave, and passes through C360 and C354 and is coupled to Pin 2 of IC302.

3.2.5. Structure of Horizontal Deflection Circuit

The function of the horizontal deflection circuit is to cause left/right scanning of the electron beam using the sawtooth wave current flowing through the horizontal deflection yoke, and is made up of the horizontal oscillator circuit, horizontal drive circuit, horizontal output circuit, synchronous AFC circuit and high voltage generator circuit.

1. Horizontal Drive Amplifier

In order to rapidly saturate the output transistor (ON) or cut it off (OFF), a sufficient basic current must be provided. Because of this, an amplifier circuit is added between the oscillator circuit and the output circuit to amplify the pulse voltage. At the same time, after the waveform has been regulated, by adding this circuit to the output circuit, this amplification circuit functions as a drive amplifier.

 IC TDA9102 consists of a vertical sawtooth wave generator, horizontal sawtooth wave generator, horizontal oscillator circuit, vertical oscillator circuit, AFC circuit, phase regulator circuit, X-RAY circuit and drive amplification circuit. This IC includes the vertical and horizontal circuits combined in one package. When the horizontal signal is sent to Pin 8 of the AFC circuit and receives a pulse back to Pin 4 from the horizontal output, the difference between these two phases is used to calculate the Automatic Frequency Control (AFC) voltage, and control the frequency of the horizontal oscillator circuit at Pin 8 through R398 R303 C322 and ZD308. The horizontal frequency is determined by the time constant of R384 R385 and C382, and is output from pin 7, coupled through T301, and supplies the base current for the horizontal output transistor Q301. This is the basic procedure of horizontal deflection.

3. Horizontal Output Circuit

The horizontal output circuit uses the switch operation of a transistor and a damping diode, and provides a sawtooth wave current to the deflection yoke. The horizontal deflection yoke is made up of the L value on the coil and resistance r inside the coil connected in series. Its resistance is extremely small, and the time constant (L/r) is extremely large. Because of this the voltage at the two terminals of the coil cause rapid variation in the current flowing in the coil still will slowly vary, creating a sawtooth current. The basic circuit and equivalent circuit are shown in Figures 3-6 and 3-7.

Figure 3-6 The Basic Deflection Circuit

Figure 3-7 Equivalent Circuit

4. Horizontal Output Circuit Operation

Refer to Figure 3-8 above for the current wave of the voltage of the horizontal output circuit during operation.

(a) t1 - t2 Period

The base of the output transistor is added to the forward bias voltage. As the current through the base is very large, it will cause the output

Figure 3-8 Horizontal Output Voltage/Current Waves

transistor to be saturated, corresponding to the ON state of S1 in the equivalent circuit. At this time the deflection yoke contains a current flow and because the time constant is large, the current will slowly show a linear increase as shown in Figures 3-8 (b) and 3-9 (a).

(b) t2-T3 Period

At t2, a negative load is applied to the to the base and the output transistor changes to OFF (S1 in open state). There is no current passing through the transistor at this time and the L and C components of the deflection yoke become independent oscillation circuits. If the current is suddenly cut off, then the polarity of the inverse voltage generated at L will be as shown in Figure 3-9, (b). This voltage is viewed as the source voltage and will cause current to flow, at which time the current flowing to C is as shown in Figure 3-8 (d). At time t3 this current is 0 but the voltage at the two capacitor terminals is at maximum. This waveform is known as flyback pulse, and is shown in Figure 3-8 (f).

(c) (t3 - t4) Period

The energy accumulated in C is released to the deflection yoke, the direction of the current flow being shown in Figure 3-9 (c). The current increases as the voltage on C decreases, and at time t4, the voltage of C is 0, at which time the current is at maximum, which means the current flowing into the deflection yoke is also maximum. C is then charged and if a damping resistor is not connected, the energy between L and C will be reversed, which is the oscillation frequency set by the oscillator at L and C.

(d) t4 - t5 Period

At t4, the voltage of C is 0. After this it is recharged in the opposite direction and this voltage exceeds the voltage of the power source at time t4. At this time the damping diode is ON and the L and C circuits are shorted out and stop oscillating. Because of this the time constant of r and L in the damping diode is large so the current flowing in the deflection yoke does not suddenly become 0.

(a) Second half of scanning period (t1 - t2)

(c) Second half of return line period (t3 - t4),

(b) First half of return line period (t2 - t3)

(d) First half of scanning period (t4 - t5)

Figure 3-9 Polarity of Transformer Voltage

The current shows a linear decrease, and when it becomes 0 at time t5 the transistor is ON and the operation described above is repeated.

(e) As described above, the current flowing in the deflection yoke during scanning is the sum of the current which has passed through the transistor and the damping diode current. Please refer to Figure 3-8(e).

3.2.6. Horizontal Size Control Circuit

The different DC value output from Pin 9-10
of IC307 passes through the distributed voltage
from R359 and R358 achieves one fixed DC
value which is sent to Pin 3 of IC302, so the
VDC from Pin 9-10 of IC307 is not the same,
causing Pin 1 of IC302 to output a different DC
volue, after passing though the buffer, collector of Q353, output to Q354 Q355 Darlington
current amplification though L304 to adjust the
current though H-DY's current value achieving size control.

3.2.7. X-RAY Protection Circuit

The feedback pulse from T302 F.B.T is regulated through D373 to obtain a DC voltage and the appropriate set voltage is distributed by R337 and R339. When the feedback pulse voltage exceeds the set voltage, the +15v output form Pin 7 of IC303, after passing through D371, R401 and input to Pin 8 of IC304. Because of this, IC304 TDA9102C is OFF, so there is no vertical or horizontal sync output form Pin 7,15 of IC304 and the monitor shuts down.

3.2.8. Horizontal linearity and CS Switching

Switching Cs is necessary to ensure the lines are in accordance with the specifications in multi-sync monitors.

- For frequencies 68~53 kHz, RL301 is on and Q302 is OFF and CS is C311.
- For frequencies 53~42 kHz, RL301 is ON and Q302 is ON and CS is C313 and C311.
- For frequencies 42~36 kHz, RL301 is OFF and Q302 is OFF and CS is C311 and C324 in parallel.
- For frequencies 36~29 kHz, RL301 is OFF and Q302 is ON and CS is C311 C313 and C324 in parallel.

3.3. Video Amplifier

The RGB video and sync signals are supplied through a video cable directly to the Video Board at connector P501. The RGB signals are terminated in 75 ohms by R501 and R503, R505 and R506.

The RGB signals then enter an LM1207 video pre-amplifier IC, providing synchronous black level clamping, variable picture contrast (gain) and RGB gain balance for color alignment. Separate gain control voltages for the three pre-amplifier channels are provided via R556, R557 and R558 from the TDA8444 DAC which is loaded by the microcontroller via the I2C bus. These inputs enable the individual gains of each channel to be varied to allow channel gain balance. In addition, a common signal is applied on pin 12 to adjust all three channels by the same amount, to allow for overall gain or contrast control.

A synchronous clamping signal is derived from the horizontal sync pulse by one half of IC504. This takes the trailing edge of the horizontal sync pulse, differentiates it through C531, then squares it via the monostable feedback action of C525 and R513 to provide a precise length digital clamping pulse which is applied IC503 via pin 14. The timing is shown in Figure 3-10, below.

- A. Clamp1 signal is generated from flyback time.
- B. When the Clamp1 signal is less than 1.4Vp-p, the IC's internal clamp loop will operate; when greater than 1.4Vp-p, it will not operate.

Figure 3-10 Timing of Pin 14 Clamp Signal

The outputs of the video pre-amplifier are fed to IC501, a hybrid power amplifier IC type LM2419, through resistors R524, R526 and R528. In addition, On screen DIsplay video information generated by IC502 can be injected via diodes D513, D514 and D515.

IC501 amplifies the video signals to around 35Vp-p. The outputs are AC coupled to the CRT cathodes via C523, C512 and C513. In order to bias the DC level of the cathodes correctly, the AC coupled signal is DC restored by clamping to a DC voltage which can be varied under microprocessor control. Considering Red channel output on IC501 as an example, the signal is clamped by D517 to the voltage set by the two transistor amplifiers formed by Q502 and Q501, which amplify the adjustable voltage at the output of the DAC. A similar stage can be seen for the green and blue channel outputs.

When the RC video signal amplification circuit is added for amplification, this waveform will change as shown in Figure 3-11 (a). Without the DC component, as shown in Figure 3-12 (b), the DC level of darker and brighter displays will be

different, so when this kind of signal without a DC component is sent to the CRT, it will cause the contrast of the image to change as the signal changes. Therefore, Q501, Q502 and D517 serve as a DC clamp and the CRT's anode DC voltgae can be adjusted by the DAC.

Figure 3-11 Effect of DC Component on Waveform

IC502 is an On Screen Display processor. This is a simple video generation IC that has its own crystal oscillator, X501. by using an internal Phase Locked Loop (PLL) the IC can sync to the incoming vertical and horizontal oscillator frequencies and produce the OSD video signals once initialized and loaded by the commands and data received on the I2C bus. When the OSD display is activated, the blanking output of the IC502 also sends a signal to the blanking input of IC503 (pin 13) to provide an optional black background for the OSD display.

The RGB signals are amplified to drive the CRT by an LM2419 hybrid amplifier and capacitively coupled to the cathodes.

Brightness control is achieved by varying the bias of G1 of the CRT via a transistor stage formed by Q507 which is also driven by an output of the TDA8444. Horizontal and vertical blanking signals are coupled into this amplifier to prevent visible retrace lines.

3.4. Microprocessor And Sync Processing

The microprocessor is an 80C51 type. It has 8k internal masked ROM which contains a basic communication 'boot' routine and various other simple routines. It is also used to store the OSD icon bit maps. The main firmware routines and variable data are stored in the 8k external EEROM, IC702.

When the micro is instructed via the RS232 bus, the internal ROM boot routine will load up the EEROM with program data from the RS232 bus. Thus it can be made to load its own firmware. From then on it will run jointly out of EEROM and internal ROM. Another important routine within the internal ROM is the routine which allows data writes to made to the EEROM. This must be resident in the micro as it cannot run from the EEROM whilst writing data. IC705 and IC704 control the addressing and I/O port selection from the micro.

IC706 allows the micro to scan the front user interface switch matrix. Also specialized ports P1.6 and P1.7 form the IIC bus interface which is used internally to set the DAC values and the OSD IC.

The micro also drives the sync selection circuits. IC708 is used to set the polarity of the incoming sync signals. IC703 allows the micro to sample the vertical and horizontal syncs and to select the correct polarity on the outputs HSYNC and VSYNC appropriately. In addition, whilst sampling the polarity, the micro can measure the frequency of both syncs. By suitable selection of HSYNC and VSYNC control lines, IC703 can also select the signals derived on HDR and VRET. These two signals come from the horizontal and vertical oscillators. By measuring these with the internal timers, the micro can set up the oscillators for optimum lock to the sync signals. It does this when ever a mode change occurs.

A mode change is detected by either a change in vertical frequency, which is monitored by firmware, or by a sudden change in horizontal frequency. IC712 is clocked and reset by the horizontal sync pulse and the HDR line. If any sync pulse is not matched by a HDR pulse then an interrupt is created on the MODEC line.

When power is disturbed to the unit, the power reset line goes low. This also causes an input to the micro via the MODEC line. On detecting this interrupt, the micro first checks inputs P1.3 and P3.5. If these are also low, then it knows the MODEC interrupt was caused by an impending power failure. In this case the micro saves the current RAM data in EEROM and prepares for power off. The RESET line is delayed for 10ms by R717 and C722 to allow time for the data to be saved. The REST line then holds off the micro and the EEROM until power is good once more.

If the front panel ON/OFF button is pressed, a MODEC interrupt is also created. This time only P3.5 is pulled low so the micro can detect that the interrupt was from the front panel. In this case the micro saves the data but flips the bit which stores the last power on state. The micro is then reset. When the reset disappears the micro bring up the power in the opposite state to before, i.e., if the power was off before then power is now on. In this way the front user on/off switch can toggle the on/off state and also always act as a micro reset switch.

3.4.1. DAC Assignments

The DAC assignments are shown in the table below.

| DAC | Addr. Bits A2 - A1 - A0 | Ref. Designator | Function |
|---------|----------------------------|--------------------|---------------------------|
| DAC 0-0 | 0-0-0 | IC306 pin 9 | H PHASE1 |
| DAC 0-1 | 0-0-0 | IC306 pin 10 | VSIZE2 |
| DAC 0-2 | 0-0-0 | IC306 pin 11 | VSIZE1 |
| DAC 0-3 | 0-0-0 | IC306 pin 12 | HF1 |
| DAC 0-4 | 0-0-0 | IC306 pin 113 | HF2 |
| DAC 0-5 | 0-0-0 | IC306 pin 14 | HPHASE |
| DAC 0-6 | 0-0-0 | IC306 pin 15 | PARALLEL- OGRAM (TILT) |
| DAC 0-7 | 0-0-0 | IC306 pin 16 | VPOS |
| DAC 1-0 | 0-0-1 | IC307 pin 9 | WIDTH1 |
| DAC 1-1 | 0-0-1 | IC307 pin 10 | WIDTH2 |
| DAC 1-2 | 0-0-1 | IC307 pin 11 | ROTATE |
| DAC 1-3 | 0-0-1 | IC307 pin 12 | PIN |
| DAC 1-4 | 0-0-1 | IC307 pin 13 | KEY |
| DAC 1-5 | 0-0-1 | IC307 pin 14 | VLIN |
| DAC 1-6 | 0-0-1 | IC307 pin 15 | VFREQ |
| DAC 1-7 | 0-0-1 | IC307 pin 16 | INHPOS |
| DAC 0-0 | 0-1-0 | IC5 pin 9 | BRIGHTNESS |
| DAC 0-1 | 0-1-0 | IC5 pin 10 | G BIAS |
| DAC 0-2 | 0-1-0 | IC5 pin 11 | B BIAS |
| DAC 0-3 | 0-1-0 | IC5 pin 12 | R BIAS |
| DAC 0-4 | 0-1-0 | IC5 pin 13 | R GAIN |
| DAC 0-5 | 0-1-0 | IC5 pin 14 | G GAIN |
| DAC 0-6 | 0-1-0 | IC5 pin 15 | B GAIN |
| DAC 0-7 | 0-1-0 | IC5 pin 16 | CONTRAST |

4.1. Preparing the Display for Adjustment

Before adjusting any the display settings or making final adjustments after service, perform the following pre-test settings to prepare the display for adjustment:

- Be sure to allow the display to warm up for at least 30 minutes before making any adjustments.
- When making tests and adjustments, the CRT should be facing east or west to minimize the affect of the earth's magnetic field.
- Set the contrast control at 80% and the brightness control at 50 % for all tests unless otherwise specified.
- Thoroughly degauss the entire screen with a manual degausser before proceeding with tests.
- All test should be performed with the rated power supply voltage unless otherwise specified.

4.1.1. Test Equipment Required

The following equipment will be required to make the tests and adjustments detailed in this section:

- Video signal and pattern generator.
- □ Digital multimeter
- □ Degausser

4.2. Adjustment Procedures

4.2.1. Adjustment Sequence

This display undergoes an automatic alignment procedure during manufacture. This alignment procedure follows a fixed sequence of adjustments which are duplicated in this section. When making manual adjustments during service, you should always make the adjustments in the order given here to ensure correct results.

4.2.2. Timings Used During Adjustment

The timings required to be imput during alignment consist mostly of the preset timings stored in the display, but one non-preset timing is required for Vertical F/V adjustment. The complete list of standard preset timings and non-preset timing for use in alignment is given in the table below.

IMPORTANT NOTE

The preset timings for different versions of this model may differ from those shown here. Be sure to check the list of preset timings for the unit being serviced.

| Mode Number | Mode 1 | Mode 2 | Mode 3 | Mode 4 | Mode 5 | Mode 6 | Mode 7 | Mode 8 | Mode 9 | Mode 10 |
|--------------------|--------|--------|--------|--------|--------|--------|--------|--------|--------|---------|
| Preset (Y/N) | Y | Y | γ | Y | Y | Y | γ | Y | Υ | γ |
| Data Pixel | 1024 | 1024 | 1280 | 800 | 800 | 800 | 640 | 640 | 1024 | 640 |

Table 4-1 Preset Timings

IMPORTANT NOTE

The adjusment settings in this section are based on REVISION B of the factory alignment procedures. Appendices detailing changes in the factory alignment procedures that have occurred since publication of this service manual are available upon request.

Initial settings to be carried out manually prior to automatic alignment:

4.3. High Voltage Verification

- Check that the 75V voltage is 75V±0.1. Adjust VR1(see Figure 4-1 for location) to correct if necessary.
- Input a cross hatch pattern in 60.024kHz 1024x768 mode and adjust VRP1 on the mainboard(see Figure 4-1 for approximate location) so the high voltage is in the range 26kv±0.3kv.

Figure 4-1 Location of Mainboard

Steps used in white balance adjustment:

4.4. Background Brightness Setting

 Input a mode in 60.023kHz 1024x768 and turn external brightness to maximum. With video input at 0V,

- adjust the SCREEN VR so background brightness is approximately 1.5FL±0.1FL.
- Before carrying out white balance adjustment, make sure that the display size and linearity are in spec.

4.5. Screen Brightness Adjust

- Input a 60.023kHz 1024x768 mode timing with no video input. Adjust VR301 and make ABL no action and adjust external brightness to 0.08FL.
- Input a full white pattern, set external contrast to maxsimum and adjust VR302 and check that brightness at the center of the screen is in the range 32FL±1FL. Input a full white pattern, set external brightness to maximum and adjust VR301 and check that brightness at the center of the screen is in the range 36FL±1FL.

4.6. Magnetic Field Configuration

- 1. Configure the magnetic field as follows:
 - □ Northern hemisphere: H=0.01, V=0.45
 □ Southern hemisphere: H=0.01, V=-0.52

4.7. Tilt Verification

 Input a cross hatch pattern in 60.023kHz 1024x768 mode and use the tilt rotation key to ensure that tilt is less than lmm.

4.8. Focus Verification

- Input a full white pattern in 60.023Hz 1024x768 mode.
 Use the external brightness control to adjust background brightness so it is not visible and set external contrast so the brightness is 30FL. Switch to a display of "@" characters.
- Adjust the FBT focus VR1 and VR2 so the @ characters are as clear as possible.

4.9. Color Misconvergence

- Input a full white pattern in 60.023kHz 1024x768 mode and adjust external brightness so there is no background brightness and external contrast so the screen brightness is 30FL.
- Switch to a cross hatch pattern and verify that misconvergence in a circle measured from the center of the screen(Area A) is not greater than 0.3mm, and for all areas outside Area A is not greater than 0.4mm.

Automatic camera alignment procedure:

The procedures listed below are those carried out using the automatic Camera Alignment System(CAS). These adjustments cannot be made manually but must be performed using the CAS software provided by the manufacturer.

4.10. Primary Test Mode(56.47kHz 1024x768 mode)Performance Adjustments

H. RASTER CENTERING
 Raster area centered horizontally in the bezel.

V. RASTER CENTERING
 Raster area centered vertically in the bezel.

ROTATION(TILT)
 Raster area aligned with bezel.

4.11. Performance Adjustments for All Preset Modes

H POSITION
 Centers the display horizontally in the raster area (L-R<=1mm).</p>

H SIZE
 Configures display width as 300±3mm.

V POSITION
 Centers the display vertically in the raster area (T - B<=1mm).</p>

V SIZE
 Configures display height as 225±3mm.

V. Linearity
 Configures vertical linearity as less than 8%.

PINCUSHION
 Sets left and right pincushion distortion to less than 1.5mm.

KEYSTONE
 Sets upper and lower keystone distortion to less than 1.5mm.

PARALLELOGRAM
 Sets parallelogram distortion to less than 1.5mm

Conclusion of automatic alignment:

4.12. Image Performance Verification

Input each of the preset timings and check that the following specifications are met:

Horizontal Position
 L - R ≤3mm

 Horizontal Size 300 ±3mm.

Vertical Position
 T - B ≤3mm

 Vertical Size 225 ±3mm.

Horizontal Linearity
 H ≤ 10% (10x8 cross hatch pattern)

This calculation is based on the following formula:

$$\frac{\text{Max} - \text{Min}}{\text{Max}} \times 100\% \le 8\%$$

Vertical Linearity
 V≤8.0% (10x8 cross hatch pattern).

$$\frac{\text{Max} - \text{Min}}{\text{Max}} \times 100\% \le 8\%$$

7. Recall Button Function

Adjust H/V phase and size at random using the external controls and press the recall button. Check that the image performance has returned to be in spec, which will indicate the Recall button is functioning correctly.

4.13. Uniformity Verification

 Input a 2" square pattern in 60.023kHz 1024 x 768 mode, set contrast to maximum and check that there is no overshoot. Check that the brightness in the four corners of the screen is not less than 70% of that in the center of the screen.

4.14. Brightness Verification

- Input a 60.023kHz 1024x768 mode timing with no video input. Adjust external brightness to 0.08FL.
- Input a full white pattern and adjust external contrast to maximum then check that brightness at the center of the screen shall be more than 30FL, adjust external brightness to maximum and check that brightness at the center of the screen is 36FL±3FL.

4.15. Display Size Stability

 Inputer a full white pattern in 60.023kHz 1024x768 mode, set external brightness at 5FL and measure the display size. adjust the brightness to 30FL and remeasure the display size. The difference should be less than 2.0mm.

4.16. Color Purity Verification

- Input a full white pattern in 60.023kHz 1024 x 768 mode and adjust external brightness so there is no background brightness and adjust external contrast to 25FL. Make a visual check of color purity as follows:
 - a) Input the red (R) signal only; no green (G) or blue(B) should be visible.
 - b) Input the G signal only; no R or B should be visible.
 - c) Input the B signal only; no R or G should be visible.

4.17. Video Noise

 Input a cross hatch pattern or full white pattern in 60.023kHz 1024x768 mode and make a visual check from a distance of 48.3cm (19 inches) for any video noise or other on screen interference.

Section 9. PCB Component List

| 9.1. | Explanation of Parts Listing9-1 |
|------|---------------------------------|
| 9.2. | Main Board |
| 9.3. | Neck Board |
| 9.4. | Logic Board9-8 |
| 9.5. | Control Board |

9.1. Explanation of Parts Listing

This section contains a complete listing of the components used on the printed circuit boards contained in the system. For a listing of the mechanical parts, please refer to Section 8., Mechanical Parts.

The list of parts in this section is separated by PCB, and the order of the listing is based on the location reference (REF.) printed on the circuit board and shown in the schematics. Components without a reference location are listed at the beginning of each table in order of the part number, and the location reference of the part with which they are connected is given in the description.

For example:

| 2003097301 | HEAT SINK FOR Q1 | |
|------------|------------------|--|
| | | |

shows Part No. 2003097301, which is connected or related to the components with a location reference of Q1.

Shaded items indicate comonents that are critical for safety or arc of proprietary design and must be replaced with parts of the exact same specification or ordered directly from the manufacturer.

For example:

| 24333000 | STROUGHANDSTREES FAMOURE CONTRACTOR AND | - |
|----------|---|---|
| C. I | 4101515070 TRS. MOSFET 2SK1507 TO-220 | Ø |
| | | æ |

Indicates that the TRS. MOSFET, Part No. 4101515070 located at reference Q1, should onlybe replaced with the exact same part ordered from the manufacturer.

9.2. Main Board

Safety Standards and Approvals

- This monitor complies with DHHS Rules 21 CFR Subchapter J Applicable at date of manufacture.
- Certified to comply with the limits for a Class B computing device pursuant to part 15 of FCC rules
- Please refer to instructions included FCC notice in the user's manual if this equipment is suspected of causing interference to radio reception.

Important Safety Notice

This equipment contains special components which are important for safety. These critical parts should only be replaced with the parts specified by the manufacturer in order to prevent X-radiation, shock, fire or other hazards. Do not modify the original design.

Preface Before You Start

General Safety Precautions

- Use an isolation transformer in the power line and AC supply to troubleshoot.
- When servicing, observe the original lead dress, especially in the high voltage circuits. If a short circuit is found, replace all parts which have been overheated or damaged.
- 3. Before turning the display on, measure the resistance between B+ line and chassis ground. Connect the negative side of an ohmmeter to the B+ lines and the positive side to chassis ground. Each line should have more resistance than the following specifications:

| B+ Line | Minimum Resistance |
|---------|--------------------|
| +200V | 119.58KΩ |
| +75V | 8.77ΚΩ |
| +15.0V | 2.11ΚΩ |
| +12.0V | 0.2ΚΩ |
| -15V | 20.04ΚΩ |
| +6.3V | 4.69Ω |
| +5.0V | 1.29KΩ |

- 4. Potentials, as high as 26kV are present when this display is in operation. Operation of the display without the rear cover involves the danger of a shock hazard from the display power supply. Servicing should not be attempted by anyone who is not thoroughly familiar with the precautions necessary when working on high voltage equipment. Always discharge the anode of the picture tube to the display chassis before handling the tube.
- After servicing, be sure to check the items listed in the Safety Checkout, below before returning the serviced unit to the customer.

Safety Checkout

The following checks MUST be made after correcting the original service problem and before the unit is returned to the customer.

- Check the area of your repair for unsoldered or poorly soldered connections. Check the entire board surface for solder splashes and bridges.
- Check the inter board wiring to ensure that no wires are pinched or coated with high-wattage resistors.
- Check that all control knobs, shields, covers, ground straps and mounting hardware have been replaced. Make absolutely sure you have replaced all the insulators.
- Look for any unauthorized replacement parts, particularly transistors, that may have been installed during a previous repair. Point them out to the customer and recommend their replacement.
- Look for parts which, though functioning, show obvious signs of deterioration. Point them out to the customer and recommend their replacement.
- Check the line cord for cracks and abrasion. Recommend the replacement of any such line cord to the customer.
- After making any repair, check the B+ and HV to see whether they are at the values specified. Make sure your instruments are accurate; if your HV meter always shows a low HV, check the meter to ensure it is not malfunctioning.
- Carry out the leakage current checks as detailed below overleaf.

eakage Current Cold Check

- Unplug the AC cord and connect a jumper between the two prongs on the plug.
- Turn on the display power switch.

Use an ohmmeter to measure the resistance value between the jumpered AC plug and each exposed metallic cabinet part on the display, such as screwheads, terminals, control shafts, etc. When an exposed metallic part has a return path to the chassis, the reading should be between 240k and 5.2M. When exposed metal does not have a return path to the chassis, the reading must be 0,

eakage Current Hot Check

Plug the AC cord into the AC outlet. DO NOT use an isolation transformer for this check.

Connect a 1.5k, 10 watt resistor in parallel with a 0.15F capacitor between each exposed metallic part on the set and a good earth ground (see How to Find a Good Earth, below) as shown in the diagram below.

xample of Leakage Current Hot-Check Circuit

Use an AC voltmeter with 1000 ohms/volt or more sensitivity to measure the potential across the resistor.

Check each exposed metallic part, and measure the voltage at each point.

Reverse the polarity of the AC plug in the AC outlet and repeat the above measurements.

The potential at any point should not exceed 0.75 volt RMS. A leakage current tester (Simpson Model 229, RCA WT-540A or equivalent) may be used to make the hot checks.

tage current must not exceed 0.5 milliamp. If a measuret is outside of the specified limit, there is a possibility of ock hazard and the monitor should be repaired and reked before it is returned to the customer.

How to Find A Good Earth

A cold water pipe is a guaranteed earth ground; the cover plate retaining screw on most AC outlet boxes is also at earth ground. If the retaining screw is to be used as your earth ground, verify that it is at ground by measuring the resistance between it and a cold water pipe with an ohmmeter. The reading should be zero (0) ohms. If a cold water pipe is not accessible, connect a 60 - 100 watt trouble light (not a neon lamp) between the hot side of an AC power receptacle and the retaining screw. Try both slots, if necessary, to locate the hot side of the line. The lamp should light at normal brilliance if the screw is at ground potential.

How to Check for Earth Ground
